

CIB Mango Tree | Chat MVP

what is this?

CIB Mango Tree is an open-source software toolkit designed to detect coordinated inauthentic behavior (CIB) in social media datasets. It is aimed at researchers, data journalists, fact-checkers, and watchdogs who want to identify inauthentic online activity. The toolkit operates through an interactive command-line interface and provides various tools for analyzing datasets of social media activity to spot signs of manipulation. More information can be found on its [homepage](#) and its [technical documentation](#).

Sources

how does it work?

CIB Mango Tree works by providing a toolkit that analyzes datasets of social media activity to detect signs of coordinated inauthentic behavior (CIB). Users can run tests through an interactive command-line interface on their local computers. The toolkit includes a library of tools that start with simple tests to identify clear signs of unsophisticated CIB and progresses to more advanced tests for complex cases of manipulation.

The process involves several stages, including ideation, research, design, prototyping, and implementation. Contributors can propose new tests, discuss methodologies, and create prototypes to explore the effectiveness of different analysis methods. The goal is to identify abnormal online activity without scraping data, using datasets provided by the users.

For more details, you can refer to the [CIB Mango Tree homepage](#) and its [technical documentation](#).

Sources

what is CIB?

CIB stands for Coordinated Inauthentic Behavior. It refers to manipulative online activities where individuals or groups coordinate to create a misleading impression of authenticity, often to influence public opinion or disrupt honest conversation on social media platforms. CIB Mango Tree is designed to detect such behavior in social media datasets.

Sources

how does it do that?

CIB Mango Tree detects coordinated inauthentic behavior (CIB) by analyzing datasets of social media activity that users provide. It operates through an interactive command-line interface and offers a library of tools that start with simple tests to identify clear signs of unsophisticated CIB. As users progress, the toolkit provides more advanced tests for tackling deeper and more complex cases of manipulation.

The analysis does not involve scraping data; instead, it focuses on examining the datasets supplied by users to identify abnormal online activity. This approach allows researchers, journalists, and concerned citizens to spot disruption and safeguard honest conversation online.

For more details, you can refer to the [CIB Mango Tree homepage](#) and its [technical documentation](#).

Sources

is CIB fake news?

CIB (Coordinated Inauthentic Behavior) is not the same as fake news, but it can be related. CIB refers to manipulative online activities where individuals or groups coordinate to create a misleading impression of authenticity, often to influence public opinion. This can include spreading misinformation or fake news as part of a broader strategy to manipulate discourse on social media. Therefore, while CIB can involve fake news, it encompasses a wider range of coordinated deceptive practices online.

Sources

who are some of the bigger offenders?

The provided context does not specify any particular offenders related to coordinated inauthentic behavior (CIB) or social media manipulation. It focuses on the functionality and purpose of the CIB Mango Tree toolkit rather than identifying specific individuals or groups involved in CIB.

how can I get involved?

You can get involved with CIB Mango Tree by participating in various stages of the contribution process. Here are some ways to contribute based on your interests and availability:

1. **Learning More:** Join the community to understand the project better.
2. **Research:** Help discover new tests by reading relevant literature and proposing new ideas.
3. **Design:** Think about how to make analysis methods useful for the test library and discuss potential implementations.
4. **Prototype:** Turn ideas into proof-of-concepts for new tests.
5. **Implement:** Take prototypes and integrate them into the main codebase as analyzers.
6. **General Software Engineering:** Assist with reviewing pull requests, improving the test suite, testing performance, or enhancing the application's storage system.

To start, you can join the Civic Tech DC community chat on Slack, participate in weekly virtual calls, or attend in-person events. More information can be found in the [New Contributor Guide](#).

I'm a software developer

As a software developer, you can get involved with CIB Mango Tree by contributing in several ways:

1. **General Software Engineering:** You can help by reviewing pull requests, improving the existing test suite, testing the performance of analyzers, assisting with the interactive side (terminal, GUI), or enhancing the application's storage system.
2. **Implementing Analyzers:** If you're interested in developing new tests, you can create pull requests to introduce new analyzers to the main repository.
3. **Prototyping:** You can turn ideas into proof-of-concept tests for new methodologies.
4. **Participating in Community Events:** Join Civic Tech DC project nights or virtual calls to learn more and connect with others in the community.

To start, you can check the [New Contributor Guide](#) for more details on how to contribute.
